Pseudocode is a way of writing out a program in a simple, easy-to-read format. Instead of worrying about syntax, pseudocode uses normal words to describe what the program will do.

An algorithm is a broad set of instructions to solve a set of problems. An algorithm lays out a process or a set of rules to be followed in order to solve any problem in the set. Computer programs often use algorithms, but programs and algorithms are not the same thing. Remember, a computer program is a collection of instructions that tell a computer to perform a specific task. An algorithm lays out the logic for how to solve a whole set of problems, not just one specific task. You can write a computer program that uses an algorithm, but not all computer programs are algorithms.
